0.1 Introduction

A summary of the measurements made of the VeriWave WF1101 to support application for FCC ID YATA001Y10 and IC ID 8936A-A001Y10 .

This report covers the measurements made in the following frequency bands.

- 5.15-5.25 GHz
- 5.25-5.35 GHz
- 5.47-5.725 GHz

Test methodology is taken primarily from ANSI C63.10-2009

The testing was performed April 15 through 23, 2010 at VeriWave for unit with controller serial number 00-13-E9-1D-00-E3 and radio serial number M33142-001-0007 .

0.2 Test Equipment

Manufacturer	Model	Description	Next Cal Date

Table 1: Equipment List

0.3 Average Power

0.3.1 Specification

For the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 50 mW or 4 dBm + 10 log B, where B is the 26 dB emission bandwidth in MHz.

$$50 \text{ mW} = 17.0 \text{ dBm}$$

This power exceeds the bandwidth limited power for any $B > 20 \text{ MHz}$. Since all of the 802.11x modes have a 26dB bandwidth of greater than 20MHz, the power limit in the 5.15–5.25 GHz band is +17.0dBm.

For the 5.25–5.35 GHz and 5.47–5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz.

$$250 \text{ mW} = 24.0 \text{ dBm}$$

Again, the bandwidth limited power is greater than 24.0dBm for $B > 20 \text{ MHz}$, therefore the power limit for the 5.25–5.35 GHz and 5.47–5.725 GHz bands is +24.0dBm.

0.3.2 Measurement Procedure

The unit is connected to the power meter. The appropriate operating mode is enabled using Continuous transmit operation. Several readings are made and averaged.

Freq (MHz)	Operating Mode	Data Rate	Power (dBm)	Limit	Margin

0.5 Occupied Bandwidth, 26dB Threshold

0.5.1 Specification

15.407 (i) Emission bandwidth. For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement.

0.5.2 Measurement Procedure

Reference ANSI C63.10-2009 6.9

Measurements performed Apr 15 2010.

Testing was performed with the radio in continuous transmit mode.

1. Detector \leftarrow Peak
2. Enable Spectrum Analyzer "Occupied Bandwidth Measurement mode"
3. Ref Level \leftarrow +20dBm
4. Ref Level Offset = DUT/Spectrum Analyzer path loss
5. x dB \leftarrow 26dB
6. RBW \leftarrow 100kHz
7. VBW \leftarrow 300kHz
8. Sweep Time \leftarrow 1s
9. Query "Occupied Bandwidth Measurement mode" for x dB bandwidth

0.7 Peak Excursion

0.7.1 Specification

15.407 (a) (6) The ratio of the peak excursion of the modulation envelope (measured using a peak hold function) to the maximum conducted output power (measured as specified above) shall not exceed 13 dB across any 1 MHz bandwidth or the emission bandwidth whichever is less.

0.7.2 Measurement Procedure

Reference ANSI C63.10-2009 6.10.4.2

Testing was performed with the radio in continuous transmit mode.

1. Ref Level Offset = DUT/Spectrum Analyzer path loss
2. RBW \leftarrow 1MHz
3. VBW \leftarrow 3MHz
4. Ref Level \leftarrow +20dBm
5. Ref Level Offset = DUT/Spectrum Analyzer path loss

Measure trace 1

1. Peak Detector
2. Max Hold
3. Marker 1 \rightarrow Peak Trace 1

Measure trace 2

1. Sampling Detector
2. Power Averaging
3. 100 Averages
4. Marker 2 \rightarrow Peak Trace 2

The level of each marker is retrieved from the spectrum analyzer and the difference between the marker levels is recorded as the peak excursion.

0.8 Conducted Spurious Emissions

0.8.1 Specification

47 CFR 15.407 (b) -27dBm/MHz

Measurements performed May 17 2010.

0.8.2 Band Edge

Measurement Procedure

The start/stop frequency for each measurement is set to allow measurement of the signal and band edge of interest.

1. Ref Level Offset = DUT/Spectrum Analyzer path loss
2. detector \leftarrow PEAK
3. RBW \leftarrow 1MHz
4. VBW \leftarrow 3MHz
5. SWEEP TIME \leftarrow AUTO
6. REF LEVEL \leftarrow 20.0

Due to the noisy trace, Peak Hold is used and the trace allowed to stabilize (50 sweeps). The data is searched for the maximum level and the maximum level found in the region immediately outside of the allowed band. This value is recorded.

Freq (MHz)	Operating Mode	Data Rate	PSD (dBm/3 kHz)	Limit	Margin

0.9 Frequency Accuracy

0.9.1 Introduction

2.1055 Measurements required: Frequency stability.

(a) The frequency stability shall be measured with variation of ambient temperature as follows:

(1) From -30 to $+50$ centigrade for all equipment except that specified in paragraphs (a) (2) and (3) of this section.

All testing in this document was performed May 18, 2010 at CascadeTek for unit with controller serial number 00-13-E9-1D-00-E3 and radio serial number M33142-001-0007 .

The nominal supply voltage to the unit is 120V.

0.9.2 Measurement Procedure - Temperature

The carrier can be observed during OFDM transmit operation if the span is narrow enough. The marker count function can is then used to measure the accuracy of the carrier, which represents the frequency accuracy over all modes of operation.

Dwell time per temperature setting is at least 25 minutes.

1. Detector \leftarrow Normal
2. Ref Level \leftarrow +20dBm
3. Span \leftarrow 50kHz
4. RBW \leftarrow AUTO
5. VBW \leftarrow AUTO
6. Sweep Time \leftarrow AUTO
7. Marker Function \leftarrow COUNT

The marker peak function is used to find the frequency of the carrier.

Freq MHz	Measured Hz	Freq Error Hz	Freq Error ppm
Temp = -30.0 C

0.9.3 Measurement Procedure - Supply Variation

2.1055

(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

Using a variac to vary the supply voltage, set the voltage to -15% and +15% of nominal (120V). The actual supply voltage is verified with a multimeter.

The frequency measurement is then made in the same manner as for temperature testing.

Freq MHz	Measured Hz	Freq Error Hz	Freq Error ppm
Supply = Nominal+15% (102V)			
2412	2412001084	1084	0.45
2462	2462000835	835	0.34

5825	5825002274	2274	0.39

0.10 DFS Client Testing

0.10.1 Introduction

15.407 (h) (2) Radar Detection Function of Dynamic Frequency Selection (DFS). UNII devices operating in the 5.255.35 GHz and 5.475.725 GHz bands shall employ a DFS radar detection mechanism to detect the presence of radar systems and to avoid co-channel operation with radar systems.

The DUT for this application is a WLAN *client* which does NOT include ad-hoc or peer-to-peer modes, i.e. TX activity by the DUT is strictly controlled by the access point behavior. Unless there is a request by an access point, the DUT will not transmit.

0.10.2 Test Setup

The Access Point (AP), DUT, spectrum analyzer, oscilloscope and radar pulse generator are configured as shown in figure 1.

Since both the DUT and access point used for the DFS testing have output power less than 200mW, -62dBm was used for the radar pulse signal level.

The radar pulse level is calibrated to -62dBm at the input of the AP using a spectrum analyzer by varying the attenuation in the path from the radar pulse generator and the AP.

The DUT and radar signals are both visible at the monitoring spectrum analyzer. The TX power level of the DUT is adjusted such that the radar pulses are at a higher level than the DUT TX level (at the monitoring spectrum analyzer). This allow the spectrum analyzer to be triggered (using Video trigger) on the radar pulse level alone.

0.10.3 Data Transfer Setup

The DUT is a standalone client device which does not have the capability of displaying video data transferred to the unit. Therefore the standard multimedia file was not used, an alternate method was used instead.

The DUT unit is able to establish datastreams with the AP of specified packet size and data rate. The test was conducted with the following data transfer parameters

- Downstream (AP to DUT) 4 Mbit/s
- Upstream (DUT to AP) 2 Mbit/s
- 54 Mbit/s datarate in both directions
- 1518 byte TCP packets in both directions

The fact that the DUT and AP are using TCP, means that there is additional channel activity due to the TCP ack frames being sent in both directions in

addition to the WLAN ack frames. The overall channel utilization and activity is therefore much higher than experienced during the standard test.

It is important to note that the client is actively transmitting data upstream, i.e. to the AP, and not simply in response to the AP, which makes it readily apparent when it has stopped transmitting data due to the channel change order. This can be seen in the spectrum analyzer screen captures provided.

0.10.4 Test Results

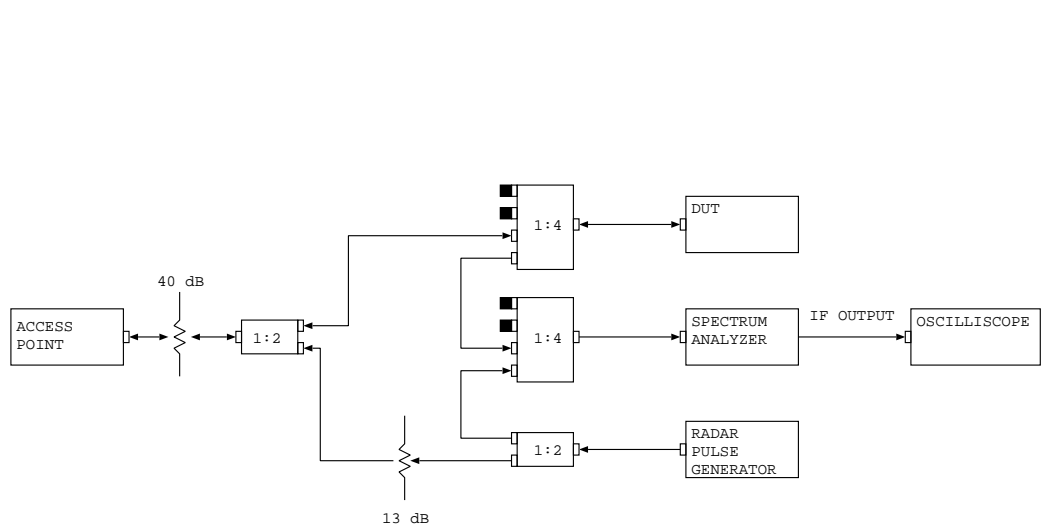

Figures 2 and 3 show the AP (lower level) and DUT/client (higher level) traffic pulses.

The radar pulse causes the AP to issue a channel change command. The DUT, upon recognizing the channel change command, ceases transmission. This is shown in figure 4. The screen captures shows that the client ceases transmission in approximately 41ms.

The DUT must also stay off the air for the next 30 minutes. The spectrum analyzer sweep time is set to 1801 sec (30 min + 1 s). The radar pulses are transmitted which triggers the spectrum analyzer and the sweep allowed to proceed.

The full 30 minute sweep is shown in figure 5.

The image in figure 6, recorded simultaneously during the 30 minute test, shows the radar pulse and the client TX.

NOTES

1. UNUSED SPLITTER PORTS ARE TERMINATED.
2. RADAR PULSE LEVEL VERIFIED -62dBm @ ACCESS POINT INPUT.
